## Spektrum dxe dsmx review

Top positive reviewAll positive reviews> 4.0 out of 5 starsA superb Bind-and-fly transmitter that does not (yet?) live up to it's full potentialReviewed in the United States on January 8, 2017Summary-----There are two ways you can look at this transmitter. The optimistic viewpoint is that it's a huge improvement over just about any other bind-and-fly remote. The upgrade is well worth the money to me.For example, I was flying the Blade Nano QX with the MLP4DSM transmitter and found it pretty twitchy in small spaces. Switching to the DXE suddenly calmed it down immensely and make it much easier to fly. The difference is in the sticks - the DXE just has a lot more of an analog throw and more fine tuned resolution.You really can't fault the build quality of this transmitter at all. At only \$60 it really holds it's own against transmitter costing several times more! I have multiple bind-and-fly models (Nano QX, Inductrix) and I \*do not have to rebind\* when switching between them. It works great.The problems start when you start looking at the trainer port (for use with a PC simulator) and the programming feature. Both are powerful capabilities and I do have them working but the road to get there was rocky and filled with dealing with half-baked software and nearly non-existent documentation. Details follow for those who are interested.Detailed Experiences-----My first goal beyond bind-and-fly, and one of the reasons I bought this model was to use it with FPV Freerider, Liftoff and other PC simulators.PC SIMULATOR:There are several way to use this transmitter with a simulator: - DSMX usb receiver: You buy a device that makes the DXE bind to the PC just like it would a quad. - Wireless trainer USB receiver. Same idea, but this one uses the "wireless trainer" feature of the DXE. - Wired trainer with "SmartPropoPlus". For this approach, you plug a 3.5mm mono plug into the transmitter and the other 3.5mm connection into your pc's mic port. You then install "SmartPropoPlus" and configure it. - Wired trainer with USB receiver. This approach is similar to the last, but you buy a 3.5 monoplug to usb adapter. The USB adapter serves same purpose as "SmartPropoPlus" without the extra software. It's reported to work a bit better.Of the above, I tried the last one (bought "Hooshion USB Flight Simulator FMS Cable") and found it did not work "out of the box" - it mostly worked but there was no throttle control. I read this is because the transmitter needs to be in "helicopter" mode instead of the "plane" mode you get by default. This means programming the transmitter. Which leads us to the last section.PROGRAMMING:You can buy three separate programming cables, none of which are included: - PC cable. This is needed to upgrade firmware. You can (sometimes) use it with a PC to download model configurations to the transmitter (including changing the model). If you have a compatible android device and a USB adapter, you can use this same cable with android too. I have a nexus 6p and this cable and it works - some android models do not work as the USB port needs to offer a host mode... - Audio cable. This one works with android and the iphone. It can be used for uploading RC models but not for firmware updates. Reports say it's a less reliable method than USB. I do not have or need this cable as the PC one works with both. - Bluetooth cable. I don't have this one and can't find any reports of others trying it.The compatibility matrix above is messy but it gets worse. Here we go (as of Jan 2017): - Transmitter firmware 1.6 is needed to access all of the model configuration features. - But you can only upgrade to 1.6 with a PC. - Once AT 1.6, you can only load models with a phone (crazy huh?) Apparently the PC software update is "in the works" but this have been the situation since June, 2016. - Also, once at 1.6 there is no way to get back to 1.3 so you are forced into a nasty irreversible decision. - There is no way to get the transmitter to tell you which model is actually loaded so you have to remember or reupload if you forget. When I have the wrong one loaded, my quads will not bind (which is better than them binding with the wrong setup - of course)All of the above really tainted my experience with the product, but I have it working. My setup: - Running at firmware 1.6 - Using a Nexus 6p with a Phone USB-C -> USB-A adapter -> Transmitter PC cable -> Transmitter connection path - When I want to use the simulator. I connect the cable, start the app and upload a generic "helicopter" model I created in the app. - When I want to fly quads, I upload the "microquad" model that I made special for themFUTURE ENHANCEMENTS (QXE2?): - All of this programming cable stuff feels really cumbersome and dated. Just put bluetooth directly in the transmitter like watches, fitbits and everything else does these days. - Any kind of way to know which model you have loaded directly from the transmitter would be great - even if it's just a single line of monochrome LCD text. - The single model limitation seems really artificial as well. Memory is so cheap, just keep them all on the transmitter and have a select button to save time. Then the programming app can be used when making, deleting and customizing models, but not for switching. Horizon Hobby RC Club: The points displayed are points you will earn based on your membership level and the cost value of the product. Points per \$1 Spent Standard Legend Elite 10 15 17.5 2000 points = \$5 Discount Points displayed here do not include Bonus Points for select product. If the product is marked with the Bonus Points badge you will also earn the extra "Bonus Points" points listed in the banner in addition to the calculated points displayed If you've ever managed a music library on your PC or smart phone, you can program the DXe. All you need is the free Spektrum programming app or software and a Spektrum programming cable (sold separately). Using this interface you can create and save basic model setups with different settings for: Servo Reversing Stick Configuration: Modes 1-4 Wing Type: Normal or Delta/Elevon Expo: On or Off For advanced programming features such as stick configuration, wing type selection, expo on/off function, model setup import and many more, the Spektrum programming cable (SPMBT1000-Mobile, SPMA3065-PC) is required. Basic programming features such as servo reversing and trim adjust can be used without the programming cable. Once saved to your PC or mobile device, you can upload the setup for a specific model to the DXe with a simple point and click. You can also use the interface to upload pre-programmed setups for Bind-N-Fly® aircraft. Save and Transfer Model Setups Select Transmitter Mode and Battery Type Enable Trainer Function Choose Normal or Elevon Wing Types Mobile Devices and PC Programming Options While the DXe looks and functions like a basic 6-channel transmitter out of the box, it gives pilots the control functions they need to fly a wide variety of Bind-N-Fly aircraft using pre-programmed setups. Functions include: Throttle, Aileron, Elevator and Rudder Channels 3-Position Flap Switch 2-Position Auxiliary Function Switch 3-Position Flight Mode Switch for AS3X/SAFE-Equipped Aircraft Bind/Panic/Return Home Button for SAFE-Equipped Aircraft
